

# Lesson 5: How Many Groups? (Part 2)

## 5.1: Reasoning with Fraction Strips

Write a fraction or whole number as an answer for each question. If you get stuck, use the fraction strips. Be prepared to share your reasoning.

1. How many  $\frac{1}{2}$ s are in 2?

2. How many  $\frac{1}{5}$ s are in 3?

3. How many  $\frac{1}{8}$ s are in  $1\frac{1}{4}$ ?

4.  $1 \div \frac{2}{6} = ?$

5.  $2 \div \frac{2}{9} = ?$

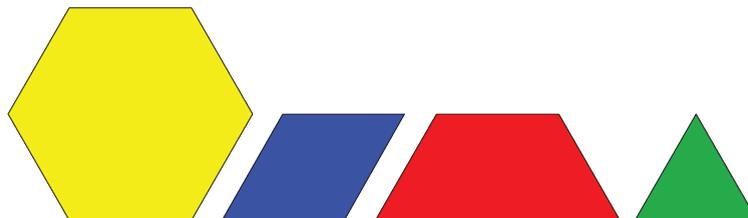

6.  $4 \div \frac{2}{10} = ?$

1										1									
$\frac{1}{2}$					$\frac{1}{2}$					$\frac{1}{2}$					$\frac{1}{2}$				
$\frac{1}{3}$			$\frac{1}{3}$			$\frac{1}{3}$			$\frac{1}{3}$			$\frac{1}{3}$			$\frac{1}{3}$				
$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$		$\frac{1}{4}$			
$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$		$\frac{1}{5}$			
$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$		$\frac{1}{6}$			
$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$		$\frac{1}{8}$			
$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$		$\frac{1}{9}$			

## 5.2: More Reasoning with Pattern Blocks

Your teacher will give you pattern blocks. Use them to answer the questions.

1. If the trapezoid represents 1 whole, what do each of the other shapes represent? Be prepared to show or explain your reasoning.

2. Use pattern blocks to represent each multiplication equation. Use the trapezoid to represent 1 whole.

a.  $3 \cdot \frac{1}{3} = 1$

b.  $3 \cdot \frac{2}{3} = 2$

3. Diego and Jada were asked “How many rhombuses are in a trapezoid?”
  - Diego says, “ $1\frac{1}{3}$ . If I put 1 rhombus on a trapezoid, the leftover shape is a triangle, which is  $\frac{1}{3}$  of the trapezoid.”
  - Jada says, “I think it’s  $1\frac{1}{2}$ . Since we want to find out ‘how many rhombuses,’ we should compare the leftover triangle to a rhombus. A triangle is  $\frac{1}{2}$  of a rhombus.”

Do you agree with either of them? Explain or show your reasoning.

4. Select **all** the equations that can be used to answer the question: “How many rhombuses are in a trapezoid?”

$\frac{2}{3} \div ? = 1$

$1 \div \frac{2}{3} = ?$

$? \div \frac{2}{3} = 1$

$? \cdot \frac{2}{3} = 1$

$1 \cdot \frac{2}{3} = ?$

### 5.3: Drawing Diagrams to Show Equal-sized Groups

For each situation, draw a diagram for the relationship of the quantities to help you answer the question. Then write a multiplication equation or a division equation for the relationship. Be prepared to share your reasoning.

1. The distance around a park is  $\frac{3}{2}$  miles. Noah rode his bicycle around the park for a total of 3 miles. How many times around the park did he ride?

2. You need  $\frac{3}{4}$  yard of ribbon for one gift box. You have 3 yards of ribbon. How many gift boxes do you have ribbon for?

3. The water hose fills a bucket at  $\frac{1}{3}$  gallon per minute. How many minutes does it take to fill a 2-gallon bucket?

#### Are you ready for more?

How many heaping teaspoons are in a heaping tablespoon? How would the answer depend on the shape of the spoons?

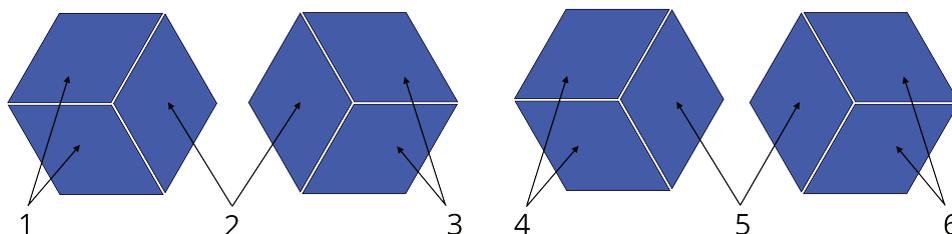

## Lesson 5 Summary

Suppose one batch of cookies requires  $\frac{2}{3}$  cup flour. How many batches can be made with 4 cups of flour?

We can think of the question as being: “How many  $\frac{2}{3}$  are in 4?” and represent it using multiplication and division equations.

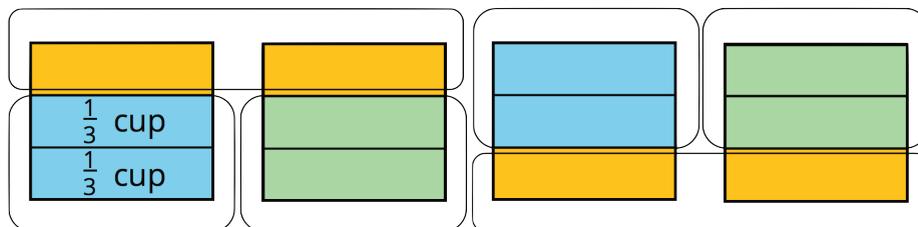

$$\begin{aligned} ? \cdot \frac{2}{3} &= 4 \\ 4 \div \frac{2}{3} &= ? \end{aligned}$$

Let’s use pattern blocks to visualize the situation and say that a hexagon is 1 whole.

Since 3 rhombuses make a hexagon, 1 rhombus represents  $\frac{1}{3}$  and 2 rhombuses represent  $\frac{2}{3}$ . We can see that 6 pairs of rhombuses make 4 hexagons, so there are 6 groups of  $\frac{2}{3}$  in 4.

Other kinds of diagrams can also help us reason about equal-sized groups involving fractions. This example shows how we might reason about the same question from above: “How many  $\frac{2}{3}$ -cups are in 4 cups?”

We can see each “cup” partitioned into thirds, and that there are 6 groups of  $\frac{2}{3}$ -cup in 4 cups. In both diagrams, we see that the unknown value (or the “?” in the equations) is 6. So we can now write:

$$\begin{aligned} 6 \cdot \frac{2}{3} &= 4 \\ 4 \div \frac{2}{3} &= 6 \end{aligned}$$
